

June 2, 2015 Daily Report

(Presenting June 1 Progress and Plans Forward)

Refugio Incident

This daily report addresses elements listed in the *Order for Removal, Mitigation or Prevention of a Substantial Threat of Oil Discharge*. The elements include descriptions of 1) significant developments, 2) work performed, 3) analytical data received, 4) treatment and disposal information, 5) schedule of work, and 6) anticipated problems and planned resolutions. The following attachments contain detailed information pertaining to each listed element:

- **Executive Summary** (describing prior day, June 1)
 - Significant Developments
 - Work Performed
 - Disposal Information

- **CTEH Summary of Environmental Sampling Efforts** (June 1)
 - Analytical Data Received to Date

- **Summary of Anticipated Problems and Resolutions** (June 2)
 - Anticipated problems and planned resolutions

- **Incident Action Plan** (Effective June 1 06:00 – June 3 06:59)
 - Schedule of Work to be Performed (Form 204)

Incident Command Post Santa Barbara
Refugio Oil Spill
Unified In All Missions
Status as of:
01 Jun 2015 / 2000
www.refugioresponse.com

Executive Summary

The ICP is currently overseeing operations in Santa Barbara and Ventura County from Gaviota to Point Mugu, 80 miles of shoreline, 30 miles of offshore and inland where the response originated. Staging Areas are located at Refugio State Beach, El Capitan East and El Capitan West. Plains All American estimates that the maximum potential release is 101,000 gallons spilled.

Tar ball sightings have been observed on Ventura, Los Angeles, and Orange County beaches. A separate Incident Command Post was established in the South Bay of Los Angeles and Orange Counties to respond to the pollution. The ICP for the Refugio Incident is responding to the Ventura County sightings. Furthermore, Ventura County activated their EOC and has placed a Liaison in the Refugio Incident ICP to help coordinate activities. The Naval Base Ventura County has also provided a liaison to the ICP due to impacts to Point Mugu. Samples have been collected at all tar ball sites and will be fingerprinted to determine if there is any correlation to the Refugio Beach Incident.

Current Impacts

- The majority of oiling is located on beaches, cobble, riprap, and on rock faces between Arroyo Hondo and El Capitan Beach. Light oiling has been discovered as far as Point Mugu (east) and 2 miles west of Arroyo Hondo (west). These areas have been targeted for manual removal as needed.
- Winds and currents have spread offshore and the leading edge eastward. Oil escaping the near shore zone is being collected by oil recovery vessels.
- Oiled areas onshore threaten sensitive and endangered species habitat areas.

Potential Impacts

- As free-floating oil progressed east, Coal Oil Point, Haskell Beach, Bacara (a 5 star resort) and Goleta Beach were oiled, however it has yet to be verified whether light oiling is from natural seepage or the current discharge. Coal Oil Point is a sensitive habitat for Plovers; Goleta Beach is a popular swimming and water sports location.
- All sensitive areas have been boomed off down to Devereaux slough which has a natural berm for exclusion.

Response Efforts

- Onshore:
 - Using hand tools, workers removed oiled soil near the culvert on the southwest side of the railroad tracks.
 - Work on the new section of pipeline continued with weld X-Ray, weld sand blast, and coating completed.
 - Work continues on cleaning the culvert area. Lane closures are expected to continue through Friday, 5 June, from 0900 to 1500. However, a major biking event that is also scheduled for Friday, 5 June, may impact operations. (more detail under the external affairs section of this summary)
- Shoreline:
 - Work crews continue clean up at work sites from Gaviota Creek, Santa Barbara County, to Hollywood Beach, Ventura County.
 - 4,580 feet of hard and sorbent boom are being sustained to protect 12 sites that have been identified in the ACP as sensitive.
 - Refugio and El Capitan state beaches are closed until 18 June, or until further notice at the discretion of the State Park.
- On Water:
 - Oil recovery vessels conducted offshore skimming of free floating oil.
 - The assigned 13 vessels and 1 barge continued booming (with both hard and sorbent boom) and skimming operations. 84 gallons of oily water mixture was collected today bringing the cumulative total to 11,999 gallons.
 - The on water recovery group continues to sustain 6000 ft of hard and sorbent boom.
 - Oil was observed from scheduled NOAA over flights. This area is prone to natural oil seepage and the environmental unit is assessing possible sources and distinction of natural seepage versus oil spilled from this response. In an abundance of caution, skimming operations continue to occur on suspected natural seeps to help minimize potential impact to ongoing shoreline cleanup activities.
 - The temporary safety zone remains in place for 6 NM of shoreline from Tajiguas creek to and including El Capitan Beach, extending out 500 yards from the shoreline. In addition, a 100 yard radius temporary safety zone remains in place around all vessels engaged in the recovery operations.
 - A 23 mile by 7 mile area offshore has been closed to fishing. CA Fish and Wildlife P/B Swordfish remains on scene to enforce fishery closure.

- A 1000 foot temporary flight restriction within a 5 mile radius of Refugio Beach remains in effect until June 6th 2015. An internal incident flight restriction remains in effect within ½ mile or an altitude of 500ft in the vicinity of Coal Oil Point to protect Snowy Plover habitat.

Impact Measurements

	TOTAL Birds			TOTAL Mammals		
Date	Live	Dead	Date Totals	Live	Dead	Date Totals
1 Jun-15	5	30	35	2	13	15
Cumulative Total	57	80	137	38	45	83

	Shoreline Oiling Categories (miles and %) - Refugio Incident

Oiled Sand	60	600
Oiled Vegetation	15	525
Oiled Debris/PPE	0	210
Oiled Soil	0	3840
Absorbent	15	105

*Numbers reflect utilization of waste management coordinator

External Affairs

- Developed draft plan for community business leader roundtable discussion to discuss economic impacts from the spill. Determination was made that RP and county partners were best suited to carry plan forward. Unified Command has passed along plan to RP community relation's team for further action.
- Unified Command representatives met with Chris Carrington with the AIDS LifeCycle Ride to end AIDS to discuss Friday's scheduled ride through the Refugio Incident response area along U.S. 101 South. The ride will pass through approximately three miles of affected area along highway 101.

Currently, only the event organizers have a permit to allow shoulder closure in areas where heavy equipment and roll-off containers are currently located.

- Four proposed courses of action were developed for both parties to present to their respective chains of command. COAs include:
 - COA1: Suspend cleanup operations to allow for ride to take place unimpeded.
 - COA2: Leave cleanup equipment in place and close one southbound traffic lane of U.S. 101 for approximately three miles for cyclists to use through the area, this option is least preferred however due to increased risk to riders and significant traffic impacts to limited transportation corridor.
 - COA3: Arrange for transport of riders and bicycles, to include vehicles and manpower, from Ryon Memorial Park in Lampoc, CA to Girsh Park in Goleta, CA.
 - COA4: Pre-stage roll-off bins and equipment off the pavement along U.S. 101 and suspend heavy equipment operations until after 3 p.m. to allow riders to travel through the area along the highway's shoulder without risk of injury from response equipment and operations. This is the preferred option and will be further developed with Operations to determine feasibility.

Tribal and Elected Officials

- Santa Ynez Tribe elders will visit the ICP on Wednesday, 3 June.
- Chumash tribal members continue to be involved / consulted with response providing cultural and archeological guidance and oversight as needed.
- Government Affairs Officer will attend the Ventura County Board of Supervisors (county OEM) meeting regarding oiling on Ventura County beaches.
- Senator Feinstein's staffer, Molly O'Brien will visit on Tuesday, 2 June.
- The CA State Deputy Attorney General, Mr. Brett Morris is expected to visit on Tuesday or Wednesday.
- Congresswomen Capps will visit the ICP and conduct a site visit or overflight on Friday, 5 June.

Personnel Involved

- 1063 workers are engaged in Field Operations.
- 139 personnel are assigned to the ICP.

Refugio Incident

Summary of CTEH® Environmental Sampling Efforts

June 1, 2015

As part of response efforts, CTEH® began collecting product and environmental samples, i.e., water and/or sediment, on May 20, 2015. This environmental sampling has been conducted under a Unified Command-approved sampling plan. This report contains environmental sampling efforts completed to date by CTEH® in support of Refugio Incident response efforts. **Table 1**, below, provides a sample count for each type of environmental media collected by CTEH®. **Table 2** provides a summary of TPH¹ data reported in water samples to date. Maps of environmental sampling locations are provided as attachments.

Table 1: Environmental Preliminary Sample Summary
05/20/2015– 05/31/2015

Media	Matrix	Sample Count
Water	Surface Water	90
	Water Column	32
	Culvert/Flush Water	2
Sediment	Beach Sediment ²	18
	Ocean Sediment ³	9
Soil	Backfill Soil	6
Petroleum	Product/Tar Ball Sample	31

² Beach sediment samples are collected from both the intertidal zone and on dry sand above the intertidal zone.

³ Ocean sediment samples were collected at the same location as the water column samples.

Table 2: TPH¹ Preliminary Data Summary⁴
05/20/2015– 05/31/2015

	Location	Highest Detection		Most Recent TPH Result Received	
		Date	TPH (mg/L)	Date	TPH (mg/L)
Water Column	D001-S	5/27/2015	0.179	5/29/2015	ND
	D001-M	5/22/2015	0.1	5/29/2015	ND
	D001-D	5/28/2015	0.188	5/29/2015	ND

Summary of Anticipated Problems and Resolutions

Refugio Incident

June 2, 2015

Anticipated Problems	Planned Resolutions
<input type="checkbox"/> Safety related issues due to weather or tidal cycles.	<input type="checkbox"/> Plan work accordingly while working with safety and NOAA to coordinate all response activities to be complete according to Site Safety Plan and opportune tidal times.
<input type="checkbox"/> Permitting with the county and other authorities.	<input type="checkbox"/> Work with county and local officials in the ICP to coordinate all required permitting so all permits are completed prior to work commencing.
<input type="checkbox"/> Cultural considerations.	<input type="checkbox"/> Continue to work with cultural monitoring specialist to ensure we have resources available to monitor all response activities in cultural sensitive areas.
<input type="checkbox"/> Safety related issues referring to highway traffic on 101 near Refugio Staging and Section 1 entrance and exit.	<input type="checkbox"/> Look into proper signage referring to trucks entering highway at both locations, or possible traffic control.

7. Work Assignments					
<p>Wildlife Recon Team - Collect real time data on animals at risk and staff the Wildlife Hotline.</p> <p>Wildlife Recovery Teams - Coordinate and supervise recovery of live and dead oiled wildlife in assigned Divisions and in response to reports.</p> <p>Transport - Coordinate and supervise transport of collected animals between Recovery, Field Stabilization and Care Teams.</p> <p>Field Stabilization - Provide first aid to live captured animals prior to transport to primary care centers.</p> <p>Care/Processing - Document oiling status, conduct intake examinations, necropsy dead animals, provide pre-wash care, clean oil from affected animals, return animals to normal function, and release in clean environment.</p>					
8. Special Instructions					
<p>Attend morning safety and planning briefing. Immediately report any injury to supervisor and complete an injury report form. *Personnel must have completed 24-hour HAZWOPER training and OWCN Wildlife Recovery Levels 1 and 2, at minimum.</p> <p>Instructions for Dead Wildlife and Natural Resource Protection:</p> <p>Any LIVE oiled wildlife (birds, mammals, or sea turtles) observed or incidentally collected in clean up operations should be immediately called in to the Wildlife Hotline at 877-823-6926.</p> <p>Any DEAD oiled birds, mammals, or sea turtles observed as part of cleanup operations should be called in to the team's supervisor. Supervisors can instruct the team in separating the oiled animal from the regular waste stream and (ideally) collecting it in a separate plastic bag, labeled with division/assignment area, and called into the Wildlife Hotline at 877-823-6926 for Recovery personnel to arrange pick up.</p> <p>It is critical that clean up teams not dispose of dead marine organisms (invertebrates, crustaceans, anything other than birds or mammals). Stockpile it in a marked area above the high tide line and a Natural Resource Damage Assessment (NRDA) field team will come by around midday/before high tide to ID and catalogue the spill related mortality.</p> <p>Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.</p>					
SAFETY MESSAGE					
All response personnel are to be cautious of moving vehicles at all times and look in all directions before proceeding. Response personnel should be aware that all railroad tracks are in active use and should show extreme caution when operating in vicinity of tracks.

ASSIGNMENT LIST			ICS 204-CG (Rev.10/07)		

HISTORICAL/CULTURAL GUIDELINES

- Leave cultural materials in place at the site of discovery, and mark its location.
- Stop clean-up work in the vicinity surrounding the site, within a 5ft radius.
- Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude.

Report All injuries require a immediate notification to Direct Supervisor.

Animal carcasses that have orange flagging indicates that no further action is needed. These flagged animals have already been assessed and reported.

8. Work Assignment Special Instructions, Special Equipment/Supplies Needed for Assignment WILDLIFE RECOVERY GROUP MINIMIZATION MEASURES Habitat-specific Measures These measures are intended to minimize impacts to all biological resources within the habitat and should be implemented to the extent possible regardless of whether listed species are present. Marine <ul style="list-style-type: none"> • Avoid entering kelp beds as much as possible. • Avoid boat traffic traveling near or through flocks of seabirds nesting in the water. • Have a wildlife monitor present on all posts. • No spill response activities should take place within 1,000 feet of nesting seabirds. • If a sea otter is observed, keep all response activities as far away from the animal(s) as possible until an expert can be consulted. Riparian <ul style="list-style-type: none"> • Avoid entering wetted areas as much as possible. • Avoid disturbing vegetation as much as possible. • The number of access routes, size of staging areas, and the total area of the response should be limited to the minimum necessary to achieve the mission. • During the typical breeding season for riparian birds (March 1 - September 15), a biologist should survey riparian vegetation to identify, flag and avoid nests as much as possible. • Vegetation should be hand trimmed to remove affected portions as necessary; roots should be left in place. • Response activities should avoid or minimize changes in channel morphology. • No heavy equipment (bobcats, back hoes, etc.) or earth moving in, or next to the creek shall be used without prior DFW approval. • Any listed plant species should be flagged and avoided. • For areas potentially occupied by California red-legged frogs, least Bell's vireo, southwestern willow flycatchers, see species-specific minimization measures. Sandy Beach/Dune <ul style="list-style-type: none"> • Avoid entering vegetated dune habitat as much as possible. • If vehicle traffic is required in the beach, travel should be restricted to the wet sand as much as possible and should avoid driving over wrack. • Vehicle traffic should be operated at slow enough speeds to avoid/minimize impacts to wildlife (approximately 5 to 10 miles per hour). • Use pre-existing access routes through dune habitat; if new access routes are necessary a biologist should be consulted on their location. • Manual oil removal techniques should be used as much as possible. • All trash or anything that would attract wildlife to the work area should be removed on a daily basis. • Dead oiled wildlife should be removed or buried to minimize the secondary oiling of scavenging species. • For areas potentially occupied by western snowy plover and/or California least terns, see species-specific minimization measures. Tidewater goby <ul style="list-style-type: none"> • Equipment and foot traffic entering wetted areas should be avoided to the maximum extent practical to prevent crushing tidewater gobies, their burrows, and eggs. • If supplemental water is used to flush culverts recommend gradually increasing the intensity/volume during the flush, as tidewater gobies aren't strong swimmers and could be injured or killed if there were sudden high currents. As the flow is being gradually increased, a biologist should be monitoring the culvert exit for tidewater gobies. • Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work. • Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site. • If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to be excavated on successive days. • Should dewatering occur, any pumps used should be fitted with an anti-entanglement device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening. • Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/minimization measures to be implemented during the response.

ASSIGNMENT LIST		06/01/2015 18:52		ICS 204-CG (Rev 10/07)	

Any DEAD oiled birds, mammals, or sea turtles observed as part of cleanup operations should be called in to the team's supervisor. Supervisors can instruct the team in separating the oiled animal from the regular waste stream and (ideally) collecting it in a separate plastic bag, labeled with division/assignment area, and called into the Wildlife Hotline at 877-823-6976 for Recovery personnel to arrange pick up.

Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.

SAFETY MESSAGE

All PPE shall be worn in accordance with the Site Specific JHA and Site Safety Plan.

Leave cultural materials in place at the site of discovery, and mark its location.

- Stop clean-up work in the vicinity surrounding the site, within a 600 radius.
- Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location as may be indicating latitude/longitude.

Report All Injuries require a immediate notification to Direct Supervisor

HAZARD MITIGATION

All personnel operating in a restricted area shall wear appropriate PPE (Minimum of Tychem, face shield, neoprene gloves and rubber boots are required for workers performing pressure wash ops).

Respiratory protection may be required to be used by all personnel based on continuous air monitoring readings.

All personnel are reminded to stay hydrated and to take breaks as needed.

Notably Assistant Safety Officer 4 safety issues arise

Workers should be cautious of slick surfaces and pressurized lines that may be present during decon ops.

ASSIGNMENT LIST		05/31/2015 19:08		ICS 204-CG (Rev.10/07)	

Any DEAD oiled birds, mammals, or sea turtles observed as part of clean-up operations should be called in to the team's supervisor. Supervisors can instruct the team in separating the oiled animal from the regular waste stream and (ideally) collecting it in a separate plastic bag, labeled with division/assignment area, and called into the Wildlife Hotline at 877-823-6926 for Recovery personnel to arrange pick up.

It is critical that clean up teams not dispose of dead marine organisms (invertebrates, crustaceans, anything other than birds or mammals). Stockpile it in a marked area above the high tide line and a Natural Resource Damage Assessment (NRDA) field team will come by around midday/before high tide to ID and catalogue the spill related mortality.

Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife.

On Water: Avoid entering kelp beds as much as possible. Avoid boat traffic traveling near or through flocks of seabirds resting on water, stay 1000 ft away from nesting seabirds. If sea otter is observed keep clear and call Mike Harris immediately. 831-212-7090

Leave cultural materials in place at the site of discovery, and mark its location.

- Stop clean-up work in the vicinity surrounding the site, within a 5ft radius.
- Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude.

8. Work Assignment Special Instructions, Special Equipment/Supplies Needed for Assignment WILDLIFE RECOVERY GROUP MINIMIZATION MEASURES Habitat-specific Measures These measures are intended to minimize impacts to all biological resources within the habitat and should be implemented to the extent possible regardless of whether listed species are present. Marine <ul style="list-style-type: none"> • Avoid entering kelp beds as much as possible. • Avoid boat traffic traveling near or through flocks of seabirds resting in the water. • Have a wildlife monitor present on all boats. • No spill response activities should take place within 1,000 feet of nesting seabirds. • If a sea otter is observed, keep all response activities as far away from the animal(s) as possible until an expert can be consulted. Riparian <ul style="list-style-type: none"> • Avoid entering wetted areas as much as possible. • Avoid disturbing vegetation as much as possible. • The number of access routes, size of staging areas, and the total area of the response should be limited to the minimum necessary to achieve the mission. • During the typical breeding season for riparian birds (March 1 – September 15), a biologist should survey riparian vegetation to identify, flag and avoid nests as much as possible. • Vegetation should be hand trimmed to remove affected portions as necessary; roots should be left in place. • Response activities should avoid or minimize changes in channel morphology. • No heavy equipment (bobcats, backhoes, etc.) or earth moving in, or next to the creek shall be used without prior DFW approval. • Any listed plant species should be flagged and avoided. • For areas potentially occupied by California red-legged frogs, least Bell's vireos, southwestern willow flycatchers, see species-specific minimization measures. Sandy Beach/Dune <ul style="list-style-type: none"> • Avoid entering vegetated dune habitat as much as possible. • If vehicle traffic is required in the beach, travel should be restricted to the wet sand as much as possible and should avoid driving over wrack. • Vehicle traffic should be operated at slow enough speeds to avoid/minimize impacts to wildlife (approximately 5 to 10 miles per hour). • Use pre-existing access routes through dune habitat; if new access routes are necessary a biologist should be consulted on their location. • Manual oil removal techniques should be used as much as possible. • All trash or anything that would attract wildlife to the work area should be removed on a daily basis. • Dead oiled wildlife should be removed or buried to minimize the secondary oiling of scavenging species. • For areas potentially occupied by western snowy plovers and/or California least terns, see species-specific minimization measures. Tidewater goby <ul style="list-style-type: none"> • Equipment and foot traffic entering wetted areas should be avoided to the maximum extent practical to prevent crushing tidewater gobies, their burrows, and eggs. • If supplemental water is used to flush culverts recommend gradually increasing the intensity/volume during the flush, as tidewater gobies aren't strong swimmers and could be injured or killed if there were sudden high currents. As the flow is being gradually increased, a biologist should be monitoring the culvert exit for tidewater gobies. • Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work. • Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site. • If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to be excavated on successive days. • Should dewatering occur, any pumps used should be fitted with an anti-entanglement device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening. • Prior to initiation of activities within occupied habitat, an informal salgale session should be performed in order to inform response personnel about the tidewater goby avoidance/minimization measures to be implemented during the response. 5. Work Assignment Special Instructions, Special Equipment/Supplies Needed for Assignment WILDLIFE RECOVERY GROUP MINIMIZATION MEASURES Habitat-specific Measures These measures are intended to minimize impacts to all biological resources within the habitat and should be implemented to the extent possible regardless of whether listed species are present. Marine <ul style="list-style-type: none"> Avoid entering kelp beds as much as possible. Avoid boat traffic traveling near or through flocks of seabirds resting in the water. Have a wildlife monitor present on all boats. No spill response activities should take place within 1,000 feet of nesting seabirds. If a sea otter is observed, keep all response activities as far away from the animal(s) as possible until an expert can be consulted. Riparian <ul style="list-style-type: none"> Avoid entering wetted areas as much as possible. Avoid disturbing vegetation as much as possible. The number of access routes, size of staging areas, and the total area of the response should be limited to the minimum necessary to achieve the mission. During the typical breeding season for riparian birds (March 1 – September 15), a biologist should survey riparian vegetation to identify, flag and avoid nests as much as possible. Vegetation should be hand trimmed to remove affected portions as necessary; roots should be left in place. Response activities should avoid or minimize changes in channel morphology. No heavy equipment (bobcats, back hoes, etc.) or earth moving in, or next to the creek shall be used without prior DFW approval. Any listed plant species should be flagged and avoided. For areas potentially occupied by California red-legged frogs, least Bell's vireos, southwestern willow flycatchers, see species-specific minimization measures. Sandy Beach/Dune <ul style="list-style-type: none"> Avoid entering vegetated dune habitat as much as possible. If vehicle traffic is required in the beach, travel should be restricted to the wet sand as much as possible and should avoid driving over wrack. Vehicle traffic should be operated at slow enough speeds to avoid/minimize impacts to wildlife (approximately 5 to 10 miles per hour). Use pre-existing access routes through dune habitat; if new access routes are necessary a biologist should be consulted on their location. Manual oil removal techniques should be used as much as possible. All trash or anything that would attract wildlife to the work area should be removed on a daily basis. Dead oiled wildlife should be removed or buried to minimize the secondary oiling of scavenging species. For areas potentially occupied by western snowy plovers and/or California least terns, see species-specific minimization measures. Tidewater goby <ul style="list-style-type: none"> Equipment and foot traffic entering wetted areas should be avoided to the maximum extent practical to prevent crushing tidewater gobies, their burrows, and eggs. If supplemental water is used to flush culverts recommend gradually increasing the intensity/volume during the flush, as tidewater gobies aren't strong swimmers and could be injured or killed if there were sudden high currents. As the flow is being gradually increased, a biologist should be monitoring the culvert exit for tidewater gobies. Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work. Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site. If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to be excavated on successive days. Should dewatering occur, any pumps used should be fitted with an anti-entanglement device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening. Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/minimization measures to be implemented during the response. Least Bell's vireos and/or southwestern willow flycatchers <ul style="list-style-type: none"> Disturbance of riparian vegetation should be avoided as much as possible. A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting

			ICS 204-CG (Rev 10/07)		

season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).

- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

ASSIGNMENT LIST		06/01/2015 19:44		ICS 204-CG (Rev 10/07)	

- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireos and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-clearing is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

1 (each)	Task Force 1	Ruben D.	CH 10	4	Report to Staging at 0600
7. Work Assignments					
As directed, deploy and maintain strategies per the Area Contingency Plan					
8. Special Instructions					
Follow site strategies as per ACP, deploying boom, sorbents and fence stakes. PPE: Tyvek suits, gloves, safety glasses, neoprene boots. PFDs are required within 10' of water or presents a risk of drowning. Offshore work on vessels are required a PFD					
Instructions for Dead Wildlife and Natural Resource Protection					
Any LIVE oiled wildlife (birds, mammals, or sea turtles) observed or incidentally collected in clean up operations should be immediately called in to the Wildlife Hotline at 877-823-6926					
Any DEAD oiled birds, mammals, or sea turtles observed as part of cleanup operations should be called in to the team's supervisor. Supervisors can instruct the team in separating the oiled animal from the regular waste stream and (ideally) collecting it in a separate plastic bag, labeled with division/assignment area, and called into the Wildlife Hotline at 877-823-6926 for Recovery personnel to arrange pick up.					
It is critical that clean up teams not dispose of dead marine organisms (invertebrates, crustaceans, anything other than birds or mammals). Stockpile it in a marked area above the high tide line and a Natural Resource Damage Assessment (NRDA) field team will come by around midday/before high tide to ID and catalogue the spill related mortality.					
Do not initiate any on-shore response or cleanup at Coal Oil Point without consulting the USFWS and California Dept of Fish and Wildlife. On Water: Avoid entering kelp beds as much as possible. Avoid boat traffic traveling near or through flocks of seabirds resting on water, stay 1000 ft away from nesting seabirds. If sea otter is observed keep clear and call Mike Harris immediately. 831-212-7090					
SAFETY MESSAGE					
All response personnel are to be cautious of moving vehicles at all times and look in all directions before proceeding. Response personnel should be aware that all railroad tracks are in active use and should show extreme caution when operating in vicinity of tracks.					
HISTORICAL/CULTURAL GUIDELINES					
<ul style="list-style-type: none"> • Leave cultural materials in place at the site of discovery, and mark its location. • Stop clean-up work in the vicinity surrounding the site, within a 8ft radius. • Immediately inform the field supervisor, who in turn, should immediately inform the FOSC and/or an appropriately designated cultural resource specialist. Obtain/provide location on map by indicating latitude/longitude. 					
Report All injuries require a immediate notification to Direct Supervisor.

8. Work Assignment Special Instructions, Special Equipment/Supplies Needed for Assignment: WILDLIFE RECOVERY GROUP MINIMIZATION MEASURES Habitat-specific Measures These measures are intended to minimize impacts to all biological resources within the habitat and should be implemented to the extent possible regardless of whether listed species are present. Marine <ul style="list-style-type: none"> Avoid entering kelp beds as much as possible. Avoid boat traffic traveling near or through flocks of seabirds resting in the water. Have a wildlife monitor present on all boats. No spill response activities should take place within 1,000 feet of nesting seabirds. If a sea otter is observed, keep all response activities as far away from the animal(s) as possible until an expert can be consulted. Riparian <ul style="list-style-type: none"> Avoid entering wetted areas as much as possible. Avoid disturbing vegetation as much as possible. The number of access routes, size of staging areas, and the total area of the response should be limited to the minimum necessary to achieve the mission. During the typical breeding season for riparian birds (March 1 – September 15), a biologist should survey riparian vegetation to identify, flag and avoid nests as much as possible. Vegetation should be hand trimmed to remove affected portions as necessary; roots should be left in place. Response activities should avoid or minimize changes in channel morphology. No heavy equipment (bobcats, back hoes, etc.) or earth moving in, or next to the creek shall be used without prior DFW approval. Any listed plant species should be flagged and avoided. For areas potentially occupied by California red-legged frogs, least Bell's vireos, southwestern willow flycatchers, see species-specific minimization measures. Sandy Beach/Dune <ul style="list-style-type: none"> Avoid entering vegetated dune habitat as much as possible. If vehicle traffic is required in the beach, travel should be restricted to the wet sand as much as possible and should avoid driving over wrack. Vehicle traffic should be operated at slow enough speeds to avoid/minimize impacts to wildlife (approximately 5 to 10 miles per hour). Use pre-existing access routes through dune habitat; if new access routes are necessary a biologist should be consulted on their location. Manual oil removal techniques should be used as much as possible. All trash or anything that would attract wildlife to the work area should be removed on a daily basis. Dead oiled wildlife should be removed or buried to minimize the secondary oiling of scavenging species. For areas potentially occupied by western snowy plovers and/or California least terns, see species-specific minimization measures. Tidewater goby <ul style="list-style-type: none"> Equipment and foot traffic entering wetted areas should be avoided to the maximum extent practical to prevent crushing tidewater gobies, their burrows, and eggs. If supplemental water is used to flush culverts recommend gradually increasing the intensity/volume during the flush, as tidewater gobies aren't strong swimmers and could be injured or killed if there were sudden high currents. As the flow is being gradually increased, a biologist should be monitoring the culvert exit for tidewater gobies. Prior to initiation of any dewatering or diversions, a qualified biologist should install 1/8 inch block nets outside the impact areas to exclude tidewater gobies. If widely separated sites are involved, more than one set of block nets should be placed to protect the work area. The nets should be installed on the first day of work and monitored thereafter for the duration of the work. Once the block nets are secured, qualified biologist(s) should remove all tidewater gobies found between the block nets using a 1/8 inch seine and dip nets, and relocate tidewater gobies to suitable habitat downstream of the proposed project site. If activities requiring block nets cannot be completed in one day, a new set or successive sets of block nets should be deployed each day, and subsequent surveys and capture/relocation performed accordingly. Fish released from one day's work should not be released into areas projected to be excavated on successive days. Should dewatering occur, any pumps used should be fitted with an anti-entrapment device(s) to prevent tidewater gobies from being drawn into the pump or impinged on intake screening. Prior to initiation of activities within occupied habitat, an informal tailgate session should be performed in order to inform response personnel about the tidewater goby avoidance/minimization measures to be implemented during the response. Least Bell's vireos and/or southwestern willow flycatchers <ul style="list-style-type: none"> Disturbance of riparian vegetation should be avoided as much as possible. 					
10. Prepared By Kyle Jellison	Date/Time 05/31/2015 18:22	11. Reviewed By (PSC) D. Sobieski	Date / Time 05/31/2015 19:00	12. Reviewed By (OSC) Chris Gregory	Date / Time 05/31/2015 19:00
ASSIGNMENT LIST		05/31/2015 18:15		ICS 204-CG (Rev. 10/07)	

- A qualified biologist should conduct surveys within suitable habitat for least Bell's vireo and southwestern willow flycatchers during the nesting season (March 1 – September 15) prior to disturbance of riparian vegetation to identify and establish exclusion buffers around any nests (generally at least 500 feet).
- Manual equipment should be used in occupied habitat as much as possible to minimize disturbance from noise.
- If vegetation removal is required, roots should be left in place as much as possible.
- A qualified biologist should be present as much as possible during activities that impact suitable habitat.

California least tern and/or Western snowy plover

- All responders should be informed of the potential for western snowy plovers and/or California least terns to be impacted and of the avoidance/minimization measures being implemented.
- A qualified biologist should identify areas that may contain nests or chicks, and any entry into these areas should be avoided.
- Any work required within nesting areas should be accompanied by a qualified biologist.
- A qualified biologist should identify and demarcate access and egress routes.
- The number of vehicles and number of vehicle trips should be reduced to the minimum needed to achieve the mission.
- All activities near nests or chicks should occur on the lower beach (wet sand), if possible.
- Watch for and avoid western snowy plovers sheltering in tire tracks and sandy depressions.
- If vehicles are used, speed should be kept to less than 10 mph, and vehicles should remain on the lower beach (wet sand), if possible. If it is not possible to remain on the lower beach (e.g., it is high tide), responders should stop every 100 m and scan ahead with binoculars to look for western snowy plovers and California least terns on the beach.
- The amount of wrack, shells, and natural debris removed from the beach should be minimized. If shoreline pre-cleaning is necessary, debris should be stockpiled in an appropriate location (avoiding nesting locations) and returned to the beach after the threat of oil is gone, to the extent practical.

Refugio Incident Overview Map Medical Access

WEATHER FORECAST FOR MONDAY 1 JUN 2015

A TROUGH WILL MOVE INTO THE REGION AND LINGER INTO MID WEEK AND THIS WILL RESULT IN ONSHORE FLOW AND AN OVERALL COOLING TREND. AFTER ONE MORE WARM AFTERNOON... TEMPERATURES WILL DROP TO A FEW DEGREES BELOW SEASONAL NORMALS BY TUESDAY AND WEDNESDAY. LOW CLOUDS AND FOG WILL MOVE ONSHORE OVERNIGHT THEN CLEAR EACH DAY BY MIDDAY. WINDS WILL INCREASE IN THE AFTERNOON AND EVENING HOURS BUT WILL REMAIN BELOW 15 MPH.

MIXED SWELLS ORIGINATING FROM THE SOUTHERN OCEAN AND FROM TROPICAL STORM ANDRES WILL PERSIST INTO MID WEEK THOUGH THE CHANNEL ISLANDS WILL BLOCK THE BULK OF THE SWELLS FROM REACHING THE SPILL AREA. SURF WILL BUILD UP TO 2 TO 3 FEET BY MONDAY AND CONTINUE THROUGH WEDNESDAY.
